

MAXPRO® VMS

Top Dealer Benefits

Simple Installation

MAXPRO® VMS offers a single installation package that installs all subsystems. Auto-discovery of Rapid Eye™, Fusion and Enterprise recorders makes it easy to capture and export clips from multiple DVRs and cameras.

Seamless Integration

Integration with Honeywell's Pro-Watch® security management system affords superior access control with alarm monitoring and video capabilities.

Reduce Investigation Time

The powerful operator messaging feature enables data sharing of incidents among operators as messages. An operator investigating a scene sends the salvo as a message to the administrator or another operator. With a simple drag and drop, the receiver can view the incident exactly as it appears in the sender's console.

Complete IP-ready System Solution

Competitors in the IP market tend to focus in one area: cameras, appliances, or software. Honeywell offers IP camera technology as well as appliances such as Fusion, MAXPRO DVR and Enterprise to create a complete system for the user.

Easy to Use

User-defined macros let you execute commonly performed operations with ease.

Increase Your Level of Control and Security

Video pursuit is made possible by simplifying the process of motion detection through a set of surrounding cameras. Empowered with advanced video features such as frame-by-frame analysis, bookmarking, loops and digitally-signed clip export, the timeline control assists you in monitoring and control.

Investigate Events and Alarms Easily

MAXPRO VMS lets you simultaneously view video captured before, during, and after every alarm, and you can also view live video from the camera which recorded the alarm. It also integrates with Active Alert intelligent video analytics to prevent missed detections and false alarms.

Increase Operator Productivity

Control multiple monitors from a single operator console. An operator sitting at a console can control or view video that is displayed on an alarm monitor. In addition, the operator can drag a video source from one monitor for physical and virtual viewing across multiple monitors.

Truly Integrated Hybrid System

MAXPRO VMS enables seamless control and operation of analog video from digital devices, and control of digital monitors from an analog keyboard. Users can perform PTZ or switch operation on an analog source from a digital monitor and perform PTZ switching control on a digital source from an analog keyboard. MAXPRO VMS also enables one-click migration support from analog matrix systems.

Constant System Health Check

The intuitive video rendering engine constantly monitors the CPU utilization and makes sure it does not exceed optimum operating capacity. By automatically altering the size of the video frame rate according to the graphics infrastructure of your operating system, the rendering engine provides an enriched video viewing experience. Redundant server configuration increases system reliability.
